

SYNTHETIC DEMO DATA - NOT A REAL PLANT RECORD

PLANT MAINTENANCE POLICY

Document MP-2026-01 | Revision 3 | Effective 1 January 2026

1. PURPOSE

1.1 This policy defines when a machine on the production floor must be taken out of service for maintenance, and who is allowed to authorise that.

2. TEMPERATURE LIMITS

2.1 Normal operating temperature for all production machinery is 85 degrees Celsius or below.

2.2 A machine recorded above 85 degrees Celsius is classified as OVERHEATING and must be scheduled for maintenance within 24 hours.

2.3 A machine recorded above 90 degrees Celsius must be stopped immediately and may not be restarted until an engineer has inspected it.

3. VIBRATION LIMITS

3.1 Vibration above 4.5 mm/s indicates bearing wear and requires inspection at the next scheduled stop.

3.2 A machine exceeding both the temperature and the vibration limit is treated as HIGH PRIORITY and is inspected before any other machine.

SYNTHETIC DEMO DATA - NOT A REAL PLANT RECORD

PLANT MAINTENANCE POLICY (continued)

4. AUTHORISATION

4.1 Any maintenance shutdown must be approved by the shift supervisor before the machine is stopped.

4.2 No automated system, dashboard or reporting tool may record that approval on the supervisor's behalf. The supervisor signs personally.

4.3 The signed approval note is filed against the machine record and kept for two years.

5. RECORDS

5.1 Daily machine readings are logged at the end of every shift.

5.2 Machines flagged OVERHEATING are re-checked on the following shift and the result is added to the same record.
